

RapidAsset

RapidAsset is an Asset/Works Management system that utilizes standard desktop web browser functionality in an easy to use customisable package

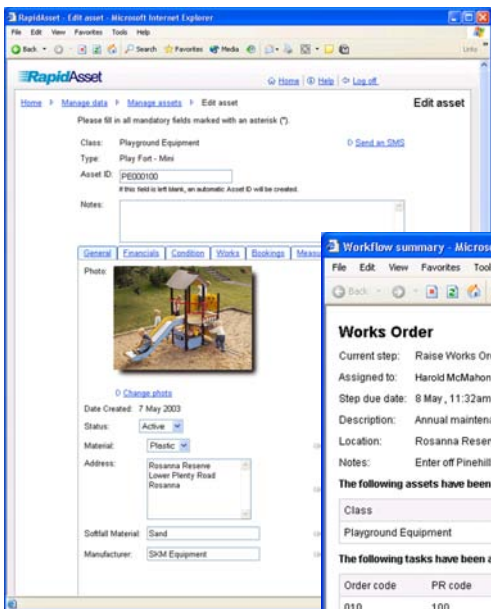

RapidMap has developed this Internet / browser based application to provide a fast, reliable and affordable corporate solution for the management of assets.

RapidAsset can show a map (Browser GIS viewer included), link to online documents, link to living floor plans of buildings, look up the history of asset inspection, asset maintenance and update tasks conducted in the field instantaneously.

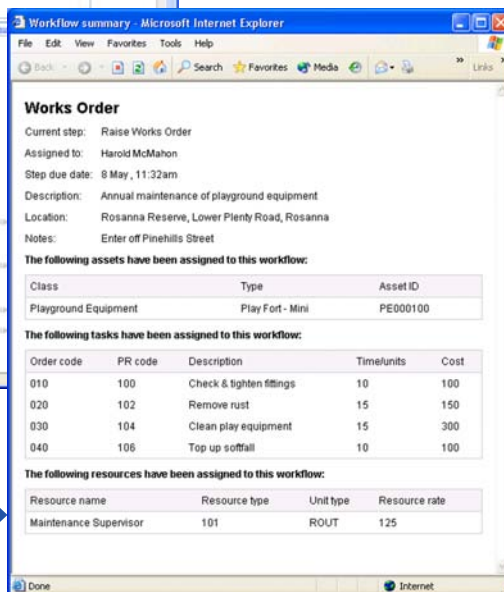

RapidAsset can be a stand-alone Asset Management system or used as a Wireless Applications Gateway to push existing fields data to the Web. This approach enables existing databases to go wireless with minimum effort. Mobile work forces such as maintenance personnel can receive and respond to works orders, enquire on assets or environmental information.

Functionality:

- Asset Register
- Workflow Process
- Maintenance Management
- Condition Monitoring
- Desktop Reporting

Use RapidAsset to view assets and associated works, conditions, bookings, documents and financials. Allocate resources and tasks required for Works Orders, and send emails, SMS or Works Orders to activate activities pertaining to a work process.

METICULOUS, PRECISE, DYNAMIC

RapidAsset has been created in line with the International Infrastructure Management guidelines providing functions such as Works Management, Resource Bookings, Reporting, Infield Data Capture and Field Inspections using a simple and effective user interface.

RapidAsset offers the latest in technology and easy to use functionality:

- Simple/Flexible custom reporting and searching, including totals
- Built in RapidLocate – convert Melway reference to references such as lat & long
- Easy to operate and roll out in your organization with web browser technology
- Unlimited user access
- Asset/Workflow Management for tailored business processing
- Link to other applications as required (custom interfaces) such as Financials, Document Management
- Links to browser based GIS and other media – incorporating the option of RapidMap's exclusive Spatial Data Server.
- Integrate to field inspection data – automatically updates results from RapidView (Field inspection on Pocket PC) to the specific asset
- Calculated Fields – incorporates the provision of calculated formulas for periodically updating fields such as valuations, depreciation

RapidMap, forward thinking, a meticulous approach
a global perspective.
